Report concerning supporting community farmers with mobile water pump to enable them boost crop production over a given land coverage:

Introduction:
 In an effort to hasten farmer's activities throughout the year we provided community farmers with a mobile water pump system. Formerly farmers had big issues with prolonged drought seasons that negatively impacted their yields. This motivated us to mobilize them to harvest rain water using different methods. Worth still water could be used for some time it's over. So a new mobile water pump is a great remedy for farmer's long term farming challenges due to drought. So far thirty (30) farmers have used the system to refill their home water tanks who later on irrigate their crops and other domestic use. Ten farmers close to the bank of Kyogya swamp have used it directed to pump and irrigate their plants directly. More farmers have showed big interest in using the system to counter prolonged drought season challenges that seemed a very big challenge to their day to day activities.

Project maintenance system:
 We have established a leader ship committee charged for system management and they drew maintenance plans as: We have two technical personnel. for fuel and the technical personnel. A small amount is charged from each farmer who uses the system to cater for future repairs and buying of new systems for the growing farmers interested in using the system. Farmers are selected based on most needy ones given more priority, location distance from the water source were those far distant are considered fast. We use small funds saved for using the system to pump water for most needy farmers who cannot pay at that moment but later when they sell off their harvests. For every homestead using the system we ask for one youths we train in using the water pump system for free such that in future when more farmers knows how to use it effectively then maintenance will be simplified further.

Verantwoording 14^e Brink tot Brinkloop

Mobiele waterpomp

Er is op 8 januari 2023 gelopen om water. Water dat noodzakelijk is om de voedselproductie van boeren in Uganda op een aanvaardbaar peil te brengen. Ook in Uganda merken de boeren de gevolgen van klimaatverandering. De regen komt niet meer op de momenten dat het nodig is en verwacht wordt.

Expenditure of project funds:
 Funds obtained were spent as:

No.	Item.	Quantity.	Rate.	from KvU
Expenditure on helping farmers adopt irrigation system that enables them improve cropproduction over given land coverage.				
1.	Water pump.	4,000,000/=	4,000,000/=	4,000,000/=
2.	Pipes.	10.	150,000/=	1,500,000/=
3.	Pipe Connectors.	20.	25,000/=	500,000/=
Grand total.			6,000,000/=	

Koers dd 15-12-2023:
 € 1,- = Ugx 4,046.27
 Ugx 6,000,000/= = € 1.482,85

De mobiele waterpomp biedt hiervoor een goed alternatief. In potentie honderden boeren kunnen hiervan gebruik maken omdat ze minder dan 500 meter van het moeras wonen. Ze kunnen irrigeren.

Dank voor jullie bijdrage vanuit de 14^e Brink tot Brinkloop.

Hierboven vindt je de verantwoording die vanuit Uganda ontvangen is.
